PROBLEM

9.25

A beam of $F_y = 50$ ksi steel is used to support the loads shown in Fig. P9-24. Neglecting the beam self-weight, determine the lightest W shape to carry the loads if full lateral bracing is provided.

 $P: P_D = 8.5 \text{ k}, P_L = 6.0 \text{ k}$

FIGURE P9-24

9-25. Redesign the beam of Prob. 9-24 if lateral bracing is only provided at the supports and at the concentrated loads. Determine C_b (Ans. W16 × 26 LRFD, W14 × 30 ASD)

Required:

a) Design Beam of Figure P9-24

Method:

- i) Determine Beam Flexural Demand
- ii) Determine Moment Distribution on the beam
- iii) Determine Cb
- iv) Determine Beam Flexural Capacity

Solution:

PROBLEM

9.32

9-32. A W21 × 93 has been specified for use on your design project. By mistake, a W21 × 73 was shipped to the field. This beam must be erected today. Assuming that ½ in thick plates are obtainable immediately, select cover plates to be welded to the top and bottom flanges to obtain the necessary section capacity. Use F_y = 50 ksi steel for all materials and assume that full bracing is supplied for the compression flange. Use LRFD

and ASD methods.

Required:

a) Select Plates to be welded on member

Method:

- i) Determine information on members
- ii) Specify trial plate thickness
- iii) Determine plate width

ANSWER

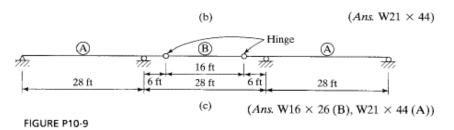

Section <u>Eq/Fig/Table</u>

- - - -

10.09

10-9. Three methods of supporting a roof are shown in Fig. P10-9. Using an elastic analysis with factored loads, F_y = 50 ksi, and assuming full lateral support in each case, select the lightest section if a dead uniform service load (including the beam self-weight) of 1.5 k/ft and a live uniform service load of 2.0 k/ft is to be supported. Consider moment only.

PROBLEM 10.27

10-27. The beam shown in Fig. P10-27 is a W14 × 34 of A992 steel and has lateral support of the compression flange at the ends and at the points of the concentrated loads. The two concentrated loads are service live loads. Check the beam for shear and for Web Local Yielding and Web Crippling at the concentrated load if $l_b = 6$ in. Neglect the self-weight of the beam. (Ans. Shear and web crippling N.G., web local yielding OK)

Required:

- a) Select lightest section considering moments, shear
- b) Web Local Yielding and Crippling at the concentrated load

Method:

- i) Determine load demand on member
- ii) Determine largest shear and moment
- iii) Enter table to obtain member with moment and shear capacity to support demand

Solution:

10-28. A 7-ft beam with full lateral support for its compression flange is supporting a moving concentrated live load of 58 k. Using 50 ksi steel, select the lightest W section. Assume the moving load can be placed anywhere in the middle 5 ft of the beam span. Choose a member based on moment then check if it is satisfactory for shear, and compute the minimum length of bearing required at the supports from the standpoint of web local yielding and web crippling. Neglect self-weight.

Required:

- a) Select lightest section considering moments, shear
- b) Web Local Yielding and Crippling at the concentrated load

Method:

- i) Determine load demand on member
- ii) Determine largest shear and moment
- iii) Enter table to obtain member with moment and shear capacity to support demand

Solution:

1) Demand:

10-30. A W21 \times 68 member is used as a simply supported beam with a span length of 12 ft. Determine C_b , since the lateral support of the compression flange is provided only at the ends. The member is uniformly loaded. The loads will produce factored moments of $M_{Dx}=75$ ft-k, $M_{Lx}=90$ ft-k and $M_{Dy}=15$ ft-k, $M_{Ly}=18$ ft-k. Is this member satisfactory for bending strength based on the interaction equation in Chapter H of the AISC Specification?

Required:

a) Determine Cb for the member

Method:

- i) Determine Member Demand
- ii) Determine Member Capacity

F

10-31. The 30-ft, simply supported beam shown in Fig. P10-31 has full support of its compression flange and is A992 steel. The beam supports a gravity service dead load of 132 lb/ft (includes beam weight) and gravity live load of 165 lb/ft. The loads are assumed to act through the c.g. of the section. Select the lightest available W10 section. (Ans. W10 × 22 LRFD, W10 × 26 ASD)

Capacity

Required:

a) Determine lightest W10 section

Method:

- i) Determine Member Demand
- ii) Determine Member Capacity

Solution:

Reference: AISC 14th Section *Eq/Fig/Table*

10-32. Design a steel bearing plate from A572 (Grade 50) steel for a W18 \times 35 beam, with end reactions of $R_D=12$ k and $R_L=16$ k. The beam will bear on a reinforced concrete wall with $f_c'=3$ ksi. In the direction perpendicular to wall, the bearing plate maximum length of end bearing may not be longer than 6 in. W18 is A992 steel.

Required:

a) Bearing Plate for concrete wall

Method:

- i) Determine Member Demand
- ii) Determine Member Capacity

Solution:
